

"There is a tool that can map child exploitation networks without ever viewing the material — and we will give it to law enforcement for free."

THE PROBLEM

Child exploitation networks operate through encrypted, pseudonymous channels. Investigators face two hard constraints: **content inspection requires viewing the material**, placing serious burdens on investigators; and **encryption defeats conventional pattern-matching** tools. Networks persist for years, actors rotate identities, and prosecution-grade evidence is difficult to assemble at scale.

WHAT AFI SEES

AFI detects behavioral anomalies in signal streams — **without ever inspecting content**. It reads the *geometry* of how data moves: timing, sequencing, transfer patterns, peer relationships, and coordination signatures that distribution networks cannot hide regardless of encryption or identity rotation.

- **Transfer Pattern Detection:** File size ranges, session timing, and sequencing consistent with distribution — detectable through encryption because the behavioral signature exists in the structure of the transfer, not the content.
- **Network Topology Mapping:** Recurring behavioral relationships between nodes even as identities rotate. AFI maps hubs, relay points, and edge actors — building the network picture investigators need for prosecution.
- **Coordination Signatures:** Multiple actors exhibiting synchronized behavioral patterns identify organized networks rather than isolated individuals — critical for establishing conspiracy and organizational structure.
- **Identity Persistence Across Sessions:** Behavioral consistency links pseudonymous sessions across time without relying on identity claims. The same behavioral fingerprint persists even through Tor and VPN layers.
- **Evidence Chain Generation:** Every detection produces a timestamped, immutable audit record — detector findings, scoring math, and analyst decisions — structured for prosecutorial and court use from the moment it fires.

PROSECUTORIAL VALUE

AFI detections cannot be challenged as *fruit of the poisonous tree* because no content is ever inspected. AFI observes only the physics of transmission — timing, topology, behavioral patterns — the equivalent of a detective noting that the same vehicle appears at the same location on the same schedule. Observable fact, not unlawful search. AFI intelligence establishes probable cause for warrants that authorize content inspection by other tools — the clean foundation prosecutors build from, not a link that can collapse a case.

THE FREE OFFER

Aletheia will deploy AFI for law enforcement child exploitation investigations **at no cost — permanently**. No pilot. No trial. No future fees. This is an unconditional commitment to this mission.

If this is the only thing we ever do and we never make a penny from it — we do it anyway.

ARCHITECTURE: WHY IT WORKS

AFI is built on a deterministic behavioral fusion engine processing **structural signal data only** — never semantic content. This is an architectural constraint, not a feature toggle. No investigator, analyst, or administrator can configure AFI to inspect content. The engine literally does not have that capability.

Conventional Tools	AFI Architecture
Require content inspection	Signal geometry only — no content ever
Blocked by encryption	Behavioral patterns persist through encryption
Investigator exposure to material	Zero exposure — ever
Single-network view only	Cross-network pattern correlation
No persistent evidence chain	Immutable audit record per detection
\$100K-\$500K+ annual licensing	Free — permanently — for law enforcement

TECHNICAL SECTION

Fusion Engine

Weighted deterministic scoring formula: $S = (w_1s_1 + w_2s_2 + \dots + w_ns_n) / (w_1 + w_2 + \dots + w_n)$. 12+ independent behavioral detectors fire in parallel. Every score is fully auditable — no black-box AI, no unexplainable outputs.

Signal Inputs

Transfer timing, session sequencing, peer relationship graphs, coordination patterns, identity behavioral consistency across sessions. No payload content required at any stage.

Phoenix Signal Network

Opt-in federated intelligence layer. Abstracted behavioral signatures — never raw data — shared across all AFI deployments. A pattern detected in one network is available to every connected investigation.

Evidence Reports

Every detection: timestamped, immutable, structured for court. Detector findings, fusion math, analyst decisions, and containment actions in a single defensible record.

Deployment

On-premises only. No data leaves the investigative environment. No cloud dependency. Runs inside existing law enforcement infrastructure.
